ICOM 4035 - 110

1. In order to run this project first unzip the file and paste inside the folder the "input.txt" file and the .csv files.

From the command prompt:

2. Open the Command Prompt.
3. cd "Directory where the folder was unzipped"/P1nnnnnnnnnn.
4. To start the java compiler in the command prompt ,the user must write exactly the next commands, without the quotation marks:
 "javac -sourcepath src src/system/theSystem.java"
5. To start the Java application in the command prompt ,the user must write exactly the next commands, without the quotation marks:
 "java -cp src system/theSystem"
6. After step 5, the .out files will be created inside the folder of the project.

From Eclipse:

1. Open the Project.
2. Inside the package "system" you will found the main class which is "theSystem".
3. Run the main class as a java application and then you will found the ".out" files inside the folder of the project.

THE PROGRAM ALREADY HAVE "input.txt" AS A TEXT FILE THAT WILL CONTAIN THE CSV FILES. IF THE USER ARE HOING TO USE A DIFFERENT TEXT FILE CONTAINING THE CSV NAMES, THE USER NEED TO ACCESS THE CLASS "theSystem" INSIDE THE PACKAGE "system" AND CHANGE "input.txt" IN LINES 56 AND 57 TO MAKE IT WORK. THANK YOU.
